TDD-Mockito

Exercise 1:Implementing the Singleton Pattern

Code:

```
import org.junit.jupiter.api.Test;

import org.mockito.Mockito;

import static org.mockito.Mockito.*;

import static org.junit.jupiter.api.Assertions.*;

public class MockingStubbingTest {

    @Test

    public void testExternalApi() {

        ExternalApi mockApi = Mockito.mock(ExternalApi.class);

        when(mockApi.getData()).thenReturn("Mock Data")

        MyService service = new MyService(mockApi);

        assertEquals("Mock Data", result);

    }

    @Test

    public void testStubWithQuery() {

        ExternalApi mockApi = Mockito.mock(ExternalApi.class);

        when(mockApi.fetchData("test")).thenReturn("Stubbed Result");
```

```
MyService service = new MyService(mockApi);

String result = service.fetchData("test");

assertEquals("Stubbed Result", result);

}
```

@Test

```
public void testStubMultipleCalls() {

    ExternalApi mockApi = Mockito.mock(ExternalApi.class);

    // Stub to return different values on consecutive calls
    when(mockApi.getData())

        .thenReturn("First Call")

        .thenReturn("Second Call");

    MyService service = new MyService(mockApi);

    assertEquals("First Call", service.fetchData());

    assertEquals("Second Call", service.fetchData());

}
```

@Test

```
public void testStubWithException() {

    ExternalApi mockApi = Mockito.mock(ExternalApi.class);

    when(mockApi.getData()).thenThrow(new RuntimeException("API
Error"));

    MyService service = new MyService(mockApi);

    assertThrows(RuntimeException.class, () -> {

        service.fetchData();

    });

}
```

Exercise 2: Implementing the Factory Method Pattern

code :

```
import org.junit.jupiter.api.Test;

import org.mockito.Mockito;

import static org.mockito.Mockito.*;

import static org.junit.jupiter.api.Assertions.*;

public class VerifyInteractionTest {

    @Test

    public void testVerifyInteraction() {

        ExternalApi mockApi = Mockito.mock(ExternalApi.class);

        MyService service = new MyService(mockApi);

        service.fetchData();

        verify(mockApi).getData();

    }

    @Test

    public void testVerifyWithArguments() {

        ExternalApi mockApi = Mockito.mock(ExternalApi.class);

        MyService service = new MyService(mockApi);

        service.fetchData("testQuery");

        verify(mockApi).fetchData("testQuery");

    }

    @Test
```

```
public void testVerifyCallCount() {  
  
    ExternalApi mockApi = Mockito.mock(ExternalApi.class);  
  
    MyService service = new MyService(mockApi);  
  
    service.fetchData();  
  
    service.fetchData();  
  
    service.fetchData();  
  
  
    verify(mockApi, times(3)).getData();  
  
}
```

@Test

```
public void testVerifyNoInteractions() {  
  
    ExternalApi mockApi = Mockito.mock(ExternalApi.class);  
  
    MyService service = new MyService(mockApi);  
  
    verifyNoInteractions(mockApi);  
  
}
```

@Test

```
public void testVerifyNeverCalled() {  
  
    ExternalApi mockApi = Mockito.mock(ExternalApi.class);  
  
    MyService service = new MyService(mockApi);  
  
    service.fetchData();  
  
    verify(mockApi, never()).processData(anyString());  
  
}  
}
```

Setting Up JUnit

Code:

```
import org.junit.jupiter.api.Test;

import static org.junit.jupiter.api.Assertions.*;

public class JUnitSetup {

    @Test

    public void testAddition() {

        int result = 2 + 3;

        assertEquals(5, result);

    }

    @Test

    public void testStringConcatenation() {

        String greeting = "Hello" + " " + "World";

        assertEquals("Hello World", greeting);

    }

    @Test

    public void testArrayLength() {

        int[] numbers = {1, 2, 3, 4, 5};

        assertEquals(5, numbers.length);

    }

}
```

OUTPUT:

```
java -Dnet.bytebuddy.experimental=true -jar  
lib/junit-platform-console-standalone-1.10.2.jar --class-path ".:lib/*" --select-class  
VerifyInteractionTest
```

♥ Thanks for using JUnit! Support its development at <https://junit.org/sponsoring>
